```

```

b. Write the code and its output.

```

print(a, na.print="-999")

## [1] 1 2 -999 4 -999 6 7

Describe the output

• When I run the vector first, it printed out the values exactly including the NA. However, when I run the it again after entering the print function, the NA changed into -999.

name <- readline(prompt="Input your name: ")

## Input your name:
age <- readline(prompt="Input your age: ")

## Input your age:
print(paste("My name is",name, "and I am",age ,"years old."))

## [1] "My name is and I am years old."

print(R.version.string)

## [1] "R version 4.4.1 (2024-06-14)"</pre>
```

Describe the output

• The program prompts the user to enter their name and age. Afterwards, the inputs are stored into the name object and age object respectively. The inputs are then showed in the printed statement because the object is called.
